User not yet conscious of needs

These research methods are a sampling of the tools available as you work to understand your users. Each method varies by both the kind of research activity taking place, and the sort of needs you’ll discover.

In some cases, all you need to do is ask. The users can articulate their needs. At other times, the research can lead both you and your users to a better understanding of what they really want. The right methods will uncover latent needs—needs the users themselves haven’t even recognized.

Test It

The sooner you start turning ideas into prototypes, the sooner you can put those prototypes in front of real users and catch your own misconceptions. Test it early, test it often—and save yourself time and money!

Get a Report

These methods offer a practical alternative to following users around 24/7. Instead, arrange for them to give you reports of their activities, so you just get the highlights.

Show Me

The places and things people interact with provide clues about what they value, what tasks they want to simplify, and what kinds of tools or technology they prefer. These methods give you access to those insights.

Tell Me

These methods are best for gathering information quickly and directly. Use caution with these methods, since what people say and what they do are often quite different.

Watch and Listen

These methods show you what tasks and goals your users work to achieve on a daily basis. More importantly, they help you recognize obstacles to your users’ progress, which often translate into golden opportunities for your new product.

Think Aloud Protocol

Ask your participant to complete specific tasks using a prototype of your product or a related existing product. Ask them to think out loud—to verbalize every thought—as they try to complete the tasks. Qualitative methods might need gentle reminders to think aloud as they proceed.

Draw Your Experience

Prepare your participants by asking them to record their habits or feelings with regard to a certain topic for a week. If you're not satisfied with the written data you get, try this: ask participants to record their activities on a daily basis. More importantly, they help you recognize obstacles to your users’ progress, which often translate into golden opportunities for your new product.

 prototype of your product or a related existing product. Ask them to think out loud—to verbalize every thought—as they try to complete the tasks. Qualitative methods might need gentle reminders to think aloud as they proceed.

Prepare your participants by asking them to record their habits or feelings with regard to a certain topic for a week. If you're not satisfied with the written data you get, try this: ask participants to record their activities on a daily basis. More importantly, they help you recognize obstacles to your users’ progress, which often translate into golden opportunities for your new product.

Card Sort

Prepare your participants as described in Draw Your Experience. Provide a small deck of cards using words and/or images relevant to your concept, and ask your participants to arrange the cards in ways that make sense to them.

Collage

Prepare your participants as described in Draw Your Experience. Invite a small group of participants to build images from provided materials. A mixture of ambiguous words, shapes, stickers, and shapes allows the participants to project their own meanings. Ask them to present and explain their collages.

Velcro Modeling

Prepare your participants as described in Draw Your Experience. Assemble a toolkit of components common to the kind of product you hope to design. For example, if you’re designing a remote control, provide various shapes that might act as the body of the remote, and provide easy to adhere buttons in a wide variety of shapes, sizes, and colors. Invite a small group of users to design their own product using those components.

User can articulate needs

1. Survey or Questionnaire
   Prepare a Web-based or paper survey and distribute to participants from your target audience. Word questions carefully to avoid leading or confusing the user, and interpret the results knowing that what people say they do and what they do are often quite different.

2. Focus Group
   Bring together a small group of carefully selected participants to discuss a certain set of topics relevant to your concept. A facilitator should keep the group on topic and ensure that everyone contributes to the discussion.

3. Interview
   Prepare a set of questions targeted to your concept, and ask users in a face-to-face setting. It is useful to have two researchers per interview session, so one can guide the discussion, and the other can take detailed notes.

4. Knowledge Mining
   Leverage the experience of people who are uniquely qualified to offer insights—early adopters, power users, seasoned veterans. Draw out their knowledge in surveys, focus groups, interviews, or brainstorming sessions.

5. Guided Storytelling
   In this interview technique, ask the participant to walk you through a real-life scenario pertaining to your concept. Guided Storytelling questions often begin, “Tell me about the last time you…”

6. Guided Tour
   Ask a participant to give you a tour of their space relevant to your concept. Pay special attention to how they customize their environment.

7. Personal Inventory
   Ask participants to show you and talk about the contents of their purses, briefcases, pockets, car, or desk drawers. Your goal is to understand what people deem important enough to carry with them or store nearby, and how they use the contents.

8. Web Usability
   Spend some time immersed in Web chat rooms or discussion boards related to your concept. To avoid disrupting the community, save questions of your own until the end of your immersion period.

9. Beeper Study
   Issue your participants beepers or cell phones. Instruct them to record what they do and what they say while using it, and what steps he is likely to take to remedy a problem.

10. Task Analysis
    List and diagram the steps your participant takes in order to achieve a given task. The task might be something as broad as choosing a bank, or as simple as logging in to verify an account balance.

11. Behavioral Mapping
    Diagram a given space, and record the movements and activities of people within that space. This careful observation can reveal breakdowns, coping mechanisms, and frequently repeated behaviors—all of which can signify opportunity for a new product, process, or technology.

12. Prototype Evaluation
    As early in the design process as possible, test low-fidelity prototypes in front of users for feedback and evaluation. Don’t present the concept. Find out how they would try to use it without much explanation.

13. Video Observation
    Arrange to record the activities of a given space over a period of time. Leave the camera long enough for participants to get comfortable, and occur the footage for insights into behavior. View the footage in time-lapse to reveal patterns of activity.

14. AEGU
    In any observational setting, use lists and sketches to record the activities, emotions, interactions, objects, and users. The process of recording each of these components in detail often reveals breakdowns in the system, which translate into opportunities for your new product.

15. Fly on the Wall
    Choose a location relevant to your product concept. Carefully observe how people interact with each other, with the environment, and with existing products, processes, or technology.

16. Card Sort
    Prepare your participants as described in Draw Your Experience. Provide a small deck of cards using words and/or images relevant to your concept, and ask your participants to arrange the cards in ways that make sense to them.

17. Collage
    Prepare your participants as described in Draw Your Experience. Invite a small group of participants to build images from provided materials. A mixture of ambiguous words, images, stickers, and shapes allows the participants to project their own meanings. Ask them to present and explain their collages.

18. Velcro Modeling
    Prepare your participants as described in Draw Your Experience. Assemble a toolkit of components common to the kind of product you hope to design. For example, if you’re designing a remote control, provide various shapes that might act as the body of the remote, and provide easy to adhere buttons in a wide variety of shapes, sizes, and colors. Invite a small group of users to design their own product using those components.

19. Think Aloud Protocol
    Ask your participant to complete specific tasks using a prototype of your product or a related existing product. Ask them to think out loud—to verbalize every thought—as they try to complete the tasks. Qualitative methods might need gentle reminders to think aloud as they proceed.

20. Draw Your Experience
    Prepare your participants by asking them to record their habits or feelings with regard to a certain topic for a week. If you’re not satisfied with the written data you get, try this: ask participants to record their activities on a daily basis. More importantly, they help you recognize obstacles to your users’ progress, which often translate into golden opportunities for your new product.

21. Card Sort
    Prepare your participants as described in Draw Your Experience. Provide a small deck of cards using words and/or images relevant to your concept, and ask your participants to arrange the cards in ways that make sense to them.

22. Collage
    Prepare your participants as described in Draw Your Experience. Invite a small group of participants to build images from provided materials. A mixture of ambiguous words, images, stickers, and shapes allows the participants to project their own meanings. Ask them to present and explain their collages.

23. Velcro Modeling
    Prepare your participants as described in Draw Your Experience. Assemble a toolkit of components common to the kind of product you hope to design. For example, if you’re designing a remote control, provide various shapes that might act as the body of the remote, and provide easy to adhere buttons in a wide variety of shapes, sizes, and colors. Invite a small group of users to design their own product using those components.
